Below, you will find two tables. The first was my original implementation, where the only thing that is wrong is the row coloring as posted in the original question. The second table is the result of my attempt to implement L.J.R.'s answer into my needs. It fixes the row coloring, but produces two new problems.

1. L.J.R.'s answer currently is incompatible with the multirow command. I was using multirow to vertically center the dates. I need either a new way to vertically center the dates, or I need compatibility with multirow.
2. L.J.R.'s table adds a lot of extra vertical space. Every row is more spaced out than a typical table, and the heads and foots are further spaced away from the table as well. I'd like the table to have tighter vertical spacing, like my original implementation.

The two tables follow, and after that is my LaTeX code.

Created before L.J.R.'s answer
The pagebreak doesn't color correctly in my implementation, but this example is only to highlight the fact that the dates are vertically centered in their cell in each row, and the vertical space between rows and between heads and foots is much smaller.

Talks, continued.

Created by modifying L.J.R.'s answer
Now, the pagebreak is colored correctly, but I can't use multirow to vertically center the dates, and the heads and foot have more vertical space between it and the table. There's also just overall more space between rows, which to me is unappealing.

Continued on next page.

Note: if I do try to use multirow, I get the following error:

```
! Missing number, treated as zero.
<to be read again>
                \__dim_eval_end:
l.263  \end
       {longtblr}
?
```

Here is my code for both tables:

Table 1.

```

Table 2.

In the preamble, in addition to what L.J.R. had, I added the following (I wanted the period, and the "vulf" command is a custom macro for the font I used in the heads and foots):

```
\DefTblrTemplate{firstfoot,middlefoot}{default}{%
  {\hfill\vulf Continued on next page.}\par
}
```

And the table itself:

```
\begingroup
\ResetRowColor
 \begin{longtblr}[
    caption = {Talks},
    entry = none,
    label = none,
 ]{
    colspec = {p{.7\textwidth -2\tabcolsep}p{.1\textwidth -2\tabcolsep}p{.2\textwidth -2\tabcolsep}},
    row{odd} = {oddcolor},
    row{even} = {evencolor},
 }
